

# Foot involvement in psoriatic arthritis

Foot problems are common in people with inflammatory arthritis. But little is known about foot involvement related to psoriatic arthritis. Our research team is conducting a national survey in Australia and New Zealand about foot problems affecting people with psoriatic arthritis. The aim of the survey is to understand more about the impact of foot involvement in this patient group in order to develop targeted assessment and treatment strategies.

The survey has been developed over the past 2 years based on best practice methods in qualitative survey design. Survey content was generated from interviews with patients and clinicians to ensure good conceptual coverage of items. Extensive pre-testing of the survey among people with psoriatic arthritis and subject experts has optimized its usability and confirmed face and content validity. Leading local and international experts have approved and commended the survey and it is now ready to disseminate.

Please encourage your patients with psoriatic arthritis to complete the survey online at [www.psoriaticfootarthritis.com](http://www.psoriaticfootarthritis.com). To be sent paper copies of the survey and flyers with the online survey link, please contact Kate Carter at [info@psoriaticfootarthritis.com](mailto:info@psoriaticfootarthritis.com)

**For more information about the study, please visit our website [www.psoriaticfootarthritis.com](http://www.psoriaticfootarthritis.com)**

Thank you for your support.
