
CAN YOU HELP US WITH RESEARCH LOOKING AT PREGNANCIES IN WOMEN WITH RHEUMATIC DISEASES?

- *Do you have an inflammatory arthritis such as rheumatoid arthritis, psoriatic arthritis, ankylosing spondylitis?*
- *Are you a woman aged over 18?*
- *Are you on or have you been on an injection treatment for your arthritis?*
- *Have you had a pregnancy or are you currently pregnant?*

If you answered “**yes**” to these questions you may be able to take part in a study which aims to **help other women with rheumatic diseases who would like to have pregnancies** in the future.

We are looking at pregnancy outcomes in women with rheumatic diseases exposed to biologics during pregnancy or around the time of conception. **This study does not alter your arthritis management in any way.**

Some examples of biologics include:-

- abatacept (Orencia)
- adalimumab (Humira)
- certolizumab (Cimzia)
- denosumab (Prolia)
- etanercept (Enbrel)
- golimumab (Simponi)
- infliximab (Remicade)
- rituximab (MabThera)
- tocilizumab (Actemra)
- tofacitinib (Xeljanz)
- ustekinumab (Stelara)

If you are interested in participating or want further information please call Katherine Poulsen on our study phone **0452 423 970** or email her at **biologicspregnancy@health.qld.gov.au**.
